

**U74CBTLV3257****CMOS IC****LOW-VOLTAGE DUAL 4-BIT
1-OF-2 FET
MULTIPLEXER/DEMULTIPLEXER****■ DESCRIPTION**

The **U74CBTLV3257** device is a 4-bit 1-of-2 high-speed FET multiplexer/demultiplexer. The low on state resistance of the switch allows connections to be made with minimal propagation delay.

The select (S) input controls the data flow. The FET multiplexers/demultiplexers are disabled when the output-enable ($\overline{OE}$) input is high.

This device is fully specified for partial-power-down applications using Ioff. The Ioff feature ensures that damaging current will not backflow through the device when it is powered down. The device has isolation during power off.

To ensure the high-impedance state during power up or power down, $\overline{OE}$ should be tied to V_{CC} through a pull-up resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

■ FEATURES

- * 5Ω Switch Connection Between Two Ports
- * Rail-to-Rail Switching on Data I/O Ports
- * Ioff Supports Partial-Power-Down Mode Operation
